

Assessment Schedule – 2013**Chemistry: Demonstrate understanding of thermochemical principles and the properties of particles and substances (91390)****Evidence Statement**

Q	Evidence	Achievement	Achievement with Merit	Achievement with Excellence
ONE (a)	Se: $[\text{Ar}]3d^{10}4s^24p^4$ or $4s^23d^{10}4p^4$ V: $[\text{Ar}]3d^34s^2$ or $4s^23d^3$ V^{3+} : $[\text{Ar}]3d^2$ where $[\text{Ar}]$: $1s^22s^22p^63s^23p^6$	<ul style="list-style-type: none"> • TWO correct from (a). 		
(b)(i) (ii) (iii)	<p>Se has more shells/electrons in energy levels further from the nucleus than O, with increased shielding from inner shells. This means there is a weaker electrostatic attraction between the nucleus and the bonded electrons, so Se has a lower electronegativity than O.</p> <p>Cl^- has an extra electron in its outermost/same energy level. This causes increased repulsion between electrons in the valence shell, so the electrons move further apart. This makes Cl^- bigger than Cl. Both Cl and Cl^- have the same number of protons/attractive force of the nucleus remains the same.</p> <p>Cl has more protons than Li. Therefore there is a greater attraction between the nucleus and outer electrons/electrons held more tightly so it is harder to remove an electron from Cl than Li.</p> <p>Even though the valence electrons of Cl are in the 3rd energy level/has an extra energy level the extra shielding is not as significant as the effect of the increased nuclear charge, so Cl has a higher first ionisation energy than Li.</p>	<ul style="list-style-type: none"> • Two valid statements from any of b(i) (ii) or (iii). 	<ul style="list-style-type: none"> • Full discussion in one of the three parts and any two other valid points. 	<ul style="list-style-type: none"> • Two full discussions and one other valid point.

(c)(i)	<p>BrF₃: T-shaped:</p> <pre> :F: :F — Br: :F: </pre>		<p>PCl₆⁻: Octahedral</p> <pre> :Cl: [:Cl: — P — :Cl:]⁻ :Cl: </pre>		<ul style="list-style-type: none"> • TWO correct Lewis diagrams. OR • TWO correct shapes. OR • ONE correct Lewis diagram and corresponding name. 	<ul style="list-style-type: none"> • ALL correct 		
(ii)	<p>There is a difference in electronegativity between S and F, so the S-F bonds are polar covalent. SF₄ has a see-saw shape (distorted tetrahedron) due to the repulsions between four bonding regions and one non-bonding region of charge, which is asymmetric therefore the polarities/dipoles do not cancel. As a result, SF₄ is a polar molecule.</p> <p>There is a difference in electronegativity between Xe and F, so the Xe-F bonds are polar covalent. XeF₄ has a square planar shape, due to the repulsions between four bonding regions and two non-bonding regions of charge; therefore the polarities/dipoles do cancel. As a result, XeF₄ is a non-polar molecule.</p>		<ul style="list-style-type: none"> • Both shapes correct OR • Both polarities correct OR • One shape and corresponding polarity • Identifies polar bonds due to F having a different electronegativity to both Xe and S. OR • Links polarity to symmetrical or asymmetrical arrangement of polar bonds. 		<ul style="list-style-type: none"> • Both polarities correct and full discussion of polarity for both molecules. OR • Both shapes correct and full discussion of shape for both. OR • Shape and polarity correct and full discussion for one molecule. OR • Both shapes and polarities correct with essentially correct discussions but omissions in both. 	<ul style="list-style-type: none"> • Correct discussion for polarities of BOTH molecules.

NØ No response; no relevant evidence.	N1 1a	N2 2a	A3 3a	A4 4a	M5 2m	M6 3m	E7 e in (b) and m in (a)(ii) or (iii)	E8 2e

Q	Evidence	Achievement	Achievement with Merit	Achievement with Excellence
THREE (a)	<p>N_2H_4 is a polar molecule. (Due the presence of the highly polar N-H bonds), there is hydrogen bonding between N_2H_4 molecules.</p> <p>CH_3F is also a polar molecule. (Due to the presence of the C-F bond), there are permanent dipole attractions between the CH_3F molecules.</p> <p>The attractive forces due to permanent dipoles in CH_3F must be weaker than the attractive forces due to hydrogen bonding in N_2H_4, because CH_3F boils at a lower temperature and they are similar masses so temporary dipole attractions are similar.</p> <p>$\text{C}_{10}\text{H}_{22}$ is a non-polar molecule. The only attractive forces between the $\text{C}_{10}\text{H}_{22}$ molecules are due to temporary dipoles. However, since $\text{C}_{10}\text{H}_{22}$ is a significantly larger molecule than N_2H_4, and CH_3F, it is more polarisable / has more electrons / greater molar mass, so its temporary dipole attractions are even stronger than the hydrogen bonds in N_2H_4. As a result, $\text{C}_{10}\text{H}_{22}$ requires the most heat energy to break its intermolecular forces and therefore has the highest boiling point.</p>	<ul style="list-style-type: none"> Identifies most significant type of intermolecular bonding for ONE molecule. Recognises that more electrons cause stronger temporary dipoles. <p>OR</p> <p>The stronger the intermolecular force the higher the boiling point/more energy required</p>	<ul style="list-style-type: none"> Correct description of intermolecular bonding for two molecules and a valid comparison. 	<ul style="list-style-type: none"> Full discussion for all THREE molecules.
(b)	$\Delta_c H^\circ = \sum \Delta_f H(\text{products}) - \sum \Delta_f H(\text{reactants})$ $= [(10 \times -393) + (11 \times -286)] - (-250)$ $= -6\,826 \text{ kJ mol}^{-1} \text{ or } (-6\,830 \text{ kJ mol}^{-1})$	<ul style="list-style-type: none"> Correct process (evidence of 10×-393, 11×-286 and 1×-250) 	<ul style="list-style-type: none"> Correct calculation, with correct units and sign. 	
(c)	<p>Enthalpy change: The combustion of liquid hydrazine is an exothermic process since $\Delta_c H^\circ$ is negative. Exothermic reactions form products that have lower energy than the reactants / energy is released and this favours the spontaneous / forward reaction.</p> <p>Entropy change: Exothermic reactions release heat to the surroundings, which makes the entropy change of the surroundings positive. As both the surroundings and the system gain entropy, this favours the spontaneous / forward reaction.</p> <p>OR</p> <p>The combustion reaction has more gas molecules in the products / goes from liquid to gas / increase in number of particles. Therefore the entropy of the system increases and this favours the spontaneous / forward reaction.</p> <p>As both enthalpy and entropy are favoured, then hydrazine readily burns / the reaction is spontaneous.</p>	<ul style="list-style-type: none"> Recognises entropy increases which favour the reaction. <p>OR</p> <p>Recognises reaction is exothermic which favours the reaction.</p>	<ul style="list-style-type: none"> Partial explanation refers to both entropy and enthalpy changes. <p>OR</p> <p>Full explanation for enthalpy or entropy change.</p>	<ul style="list-style-type: none"> Full explanation.
